# INTRODUCTION

Angels Of Ares is an Elite Investment Club built on Algorand, consisting of an internal DGC, which stands for Decentralized Governed Community, where members of our DGC who we call our Divine Council, collectively decide on the progression of the club and how to allocate funds from our vault.

The main focuses of the group are to establish multiple streams of revenue, both on Algorand and cross-chain. Our main investment focus is based in Aavegotchi, an NFT metaverse game built on the Polygon chain. The club also focuses on building a strong community, containing project creators, developers, analysts, and members of the Algorand community who come together to help each other build and grow Algorand as a whole.

Angels Of Ares appeals to both the passive investor, looking to invest and grow their holdings over time through rewards and revenue programs, as well as the active investor, looking to join at the inner level as part of the Divine Council and is able to participate in the inner workings of the club.

# HOLDER BENEFITS

### *Tokens + LP:*

Holding either $AoA tokens or AoA/ALGO LP tokens both earn the holder daily rewards in the form of stable $USDC or $ALGO. These rewards are automated and sent daily to holders straight to their wallets.

### *Angel Wings NFT:*

This is our DGC token. It represents basic membership to the AoA Club. Each Angel Wings NFT provides revenue to the holder from funds the Divine Council designates towards distribution for revenue from the AoA Vault.

# REVENUE

Daily revenue is distributed to holders of the Angel Wings NFT. Each wing receives one share out of the total wings available in circulation at any given time. Angel Wings are capped at a maximum supply of 5,000 wings, expected to be slowly released over the coming years. The founder, Angel Of Ares, accounts for 25% of all wings in circulation at any given time.

*Example:*

If members hold a total of 300 wings, Angel Of Ares would account for 100 wings, giving a 25% share of revenue. If a member holds 35 wings, they would receive 35/400 of the total revenue set to be distributed daily.

# MEMBERSHIP TIERS

*Basic Member:*

Hold 1 Angel Wings NFT, or $AoA tokens, or AoA/ALGO LP tokens. This tier receives daily rewards from our holding rewards program in the form of $USDC or $ALGO. Tokens + LP count toward our holder rewards, and the Angel Wings NFT provides revenue from our wings revenue program.

*Angel:*

Hold 1 Angel Wings NFT + Burn 100 $AoA tokens daily. This tier grants the Angel role in our Discord, offering premium features available only to those with the Angel role. Our Angels provide a constant stream of token burns at a small rate per Angel, making the collective effort have a heavy deflationary effect on the token over time.

*Divine Council:*

Hold 5 or more Angel Wings NFT. This tier grants the Divine Council role in our Discord, offering voting power equal to their held wings. Our Divine Council have access to all sections of the Discord including all Angel tier benefits, and are able to voice their opinion on how we invest funds from the vault and progress the project forward.

# AAVEGOTCHI: EXPLAINED

### *What is Aavegotchi?*

Aavegotchi is a DeFi-enabled crypto collectibles game developed by Singapore-based Pixelcraft Studios that allows players to stake Non-fungible tokens (NFTs) avatars with interest-generating tokens and interact with the Aavegotchi metaverse. It is a unique combination of Decentralized Finance (DeFi) and NFTs.

### *What is $GHST?*

GHST is the primary utility token of the Aavegotchi ecosystem and is used to buy and sell goods within the Aavegotchi world, including Aavegotchis themselves. GHST can also be staked for additional rewards and can be transferred between users just like other cryptocurrencies.

### *Why have we chosen Aavegotchi as our project's backbone?*

Aavegotchi's native token, $GHST, is backed by a stable $DAI bonding curve, meaning its price is maintained by a specific bonding curve mechanic.A token bonding curve (TBC) is a mathematical curve that defines a relationship between price and token supply.

In a typical TBC, the price increases as the supply of the token increases, and decreases as the supply decreases. Bonding Curves use a pricing algorithm to serve as an automated market maker and provide an always available source of liquidity. Users can interact with a bonding curve by staking tokens into the bonding curve's reserve pool. When they do so, the bonding curve mints the corresponding tokens for the user based on the pricing algorithm. The newly minted tokens can have specific utility and even be traded among users, but can always be exchanged back through the bonding curve for tokens in the bonding curve's reserve pool. In short, $DAI keeps $GHST as close to a stable coin as it gets.

# PARTNERSHIPS

We at Angels Of Ares have had the honor of partnering with several of the highest caliber projects in the Algorand NFT space. These projects were hand-selected for partnerships due to their respective projects' high quality of standards and level of professionalism matching our own at AoA.
